TB targets, present and future

Outline

- Current targets and principles for setting post-2015 targets
- Indicators of impact
- Disease burden projections
- Proposed global targets
- Adaptation and local targeting

Current targets

TARGETS AND INDICATORS

- Revert incidence (MDG 6c)
 - Indicator 6.9: incidence, prevalence, mortality
 - Indicator 6.10: proportion detected and cured under DOTS
- Halve prevalence and mortality (STP) of 1990 by 2015
- Eliminate TB by 2050 (<1/million)

LIMITATIONS

- Unambitious
- Proportion detected not measured in any HBC
- Baseline undocumented (no data in most countries)
- Unrealistic 1000-fold decline in incidence

Post 2015 targets - principles

- Targets should be
 - Ambitious
 - Inspirational
 - Realistic
 - Capable of catalyzing efforts in the short term
- Progress should be measurable
 - Well defined indicator
 - Measured and monitored at country level

Indicators

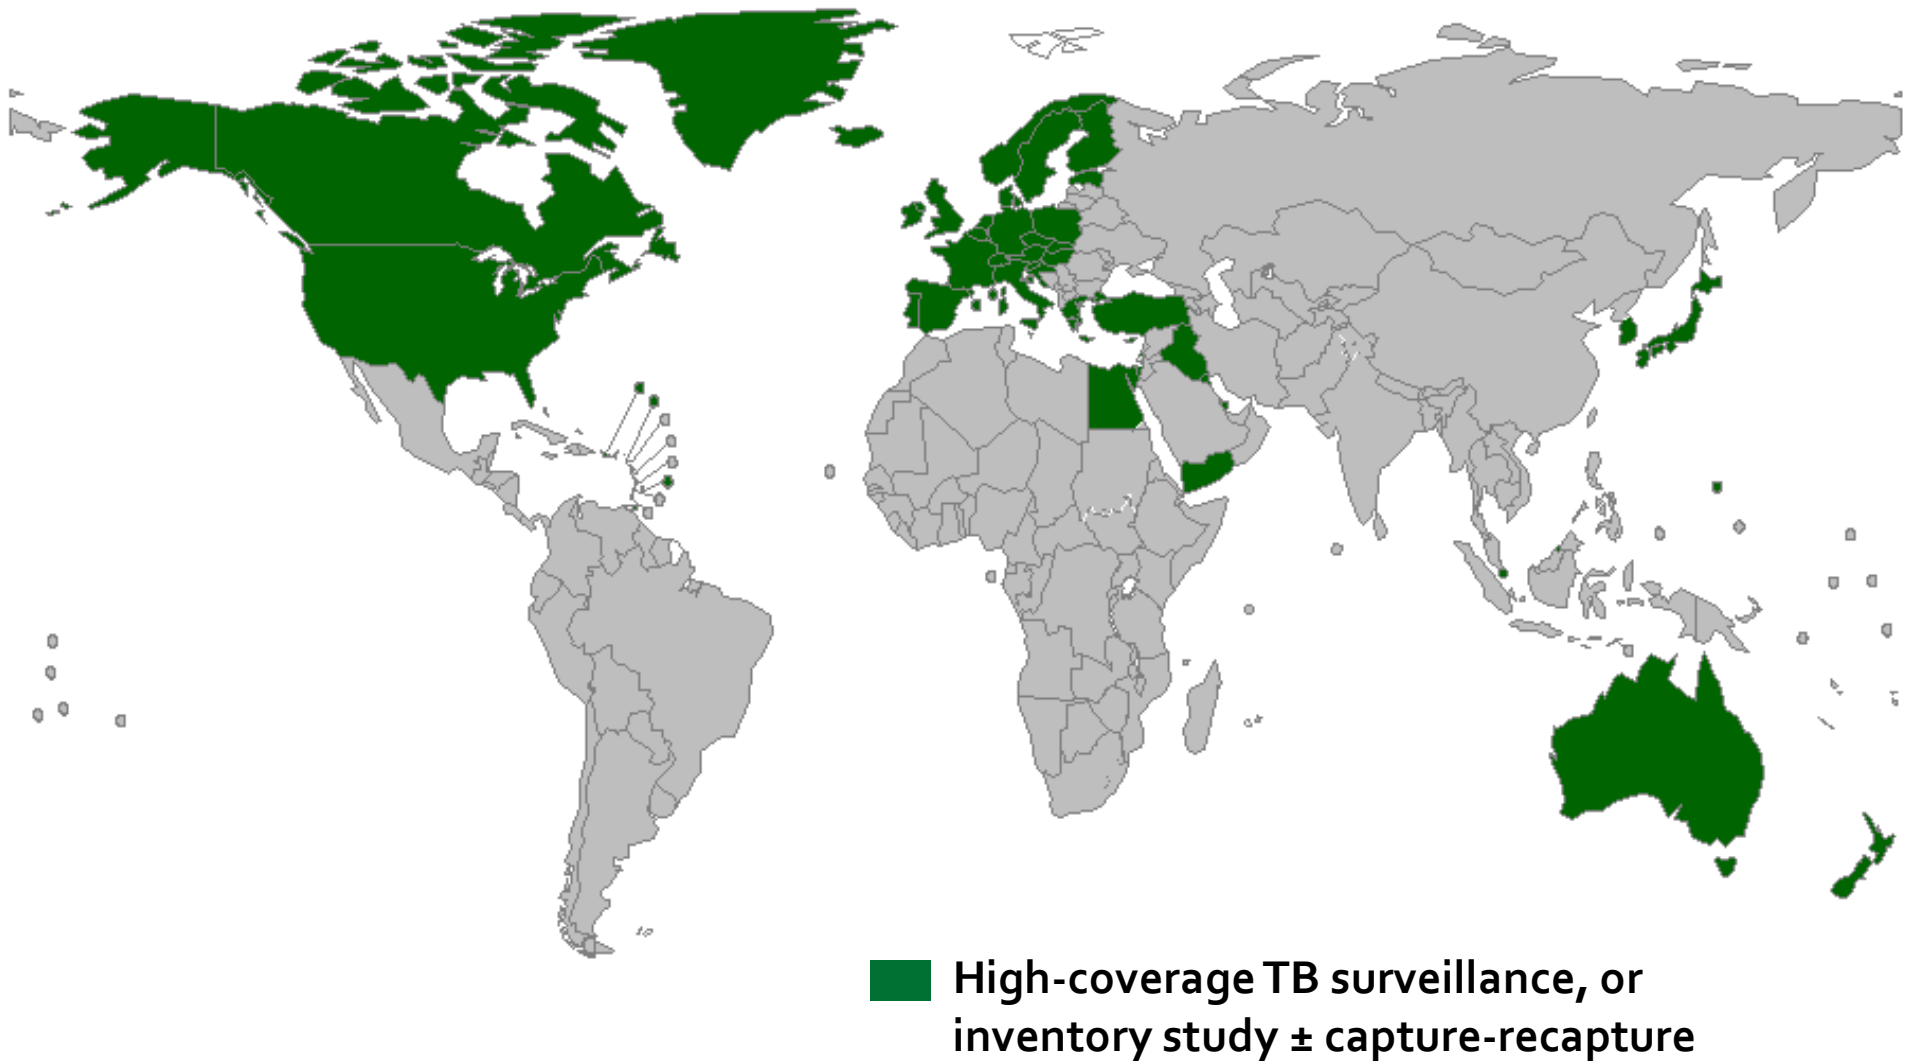

*If you change the way you look at things,
the things you look at change*

Max Plank

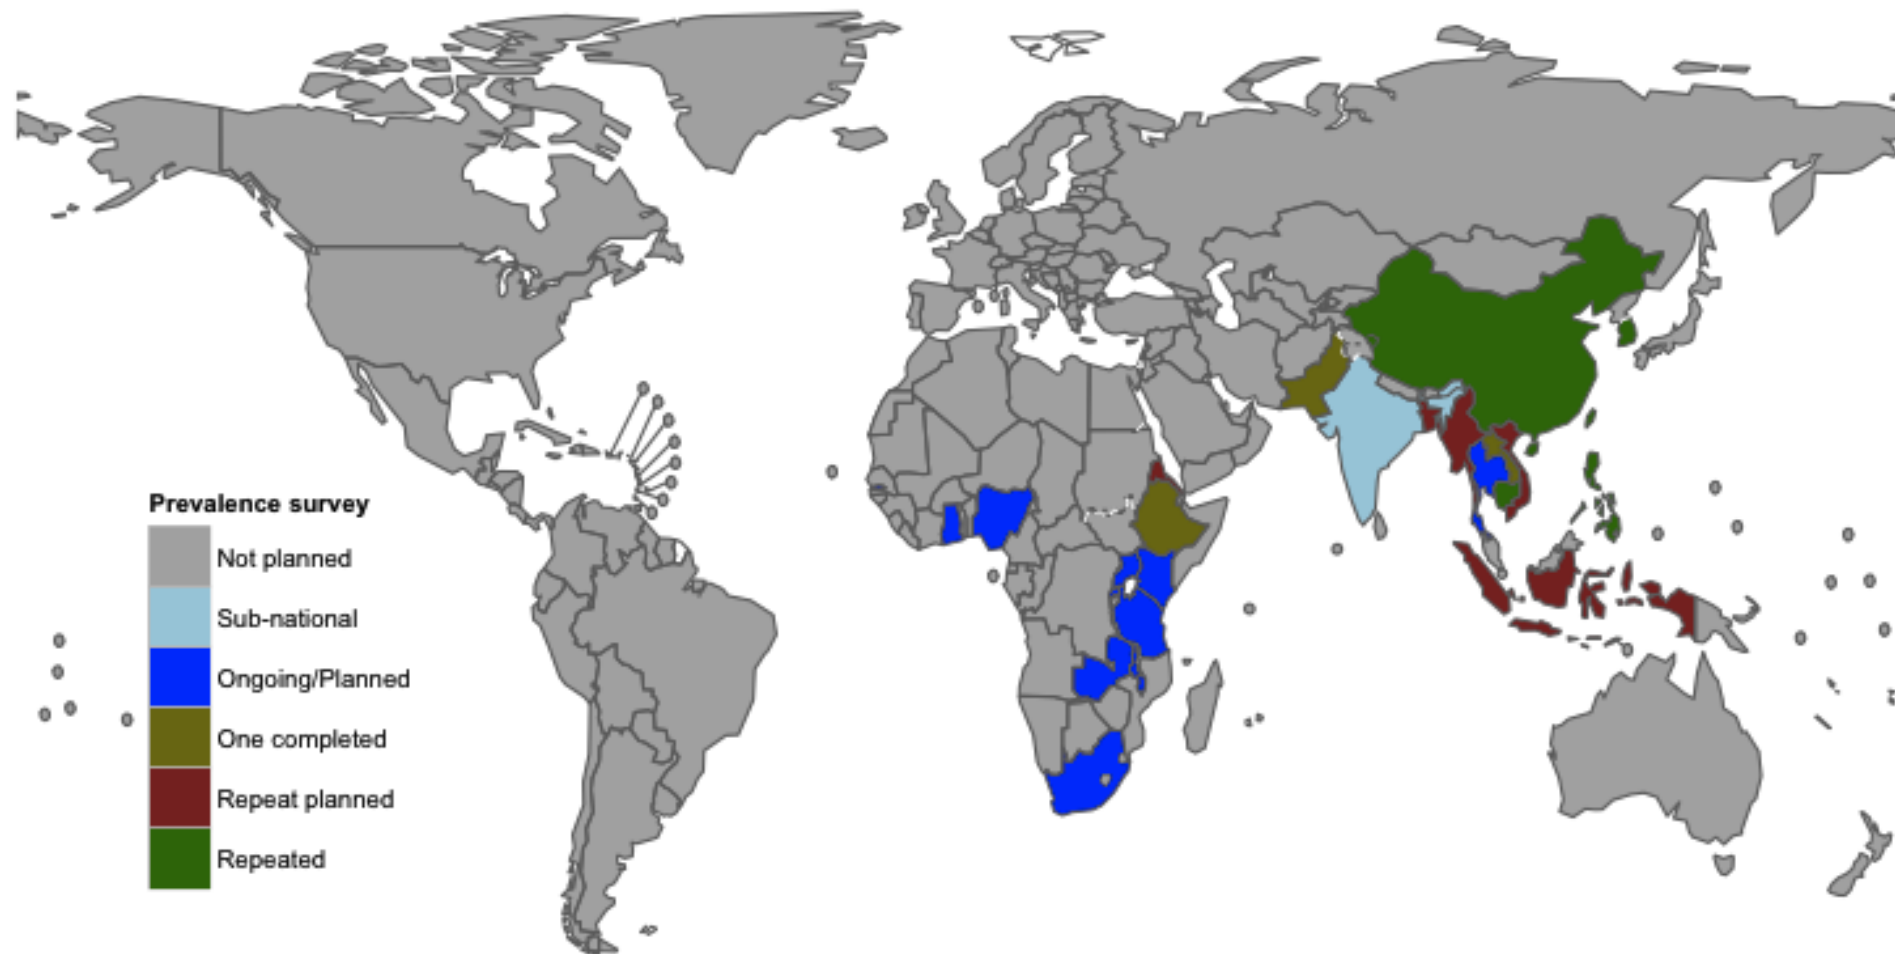

Incidence

- National incidence surveys impractical
- **Best documented through state-of-the art TB surveillance.** Estimates are uncertain due to
 - Under-reporting
 - Under-diagnosis
- Estimation from tuberculin surveys not satisfactory

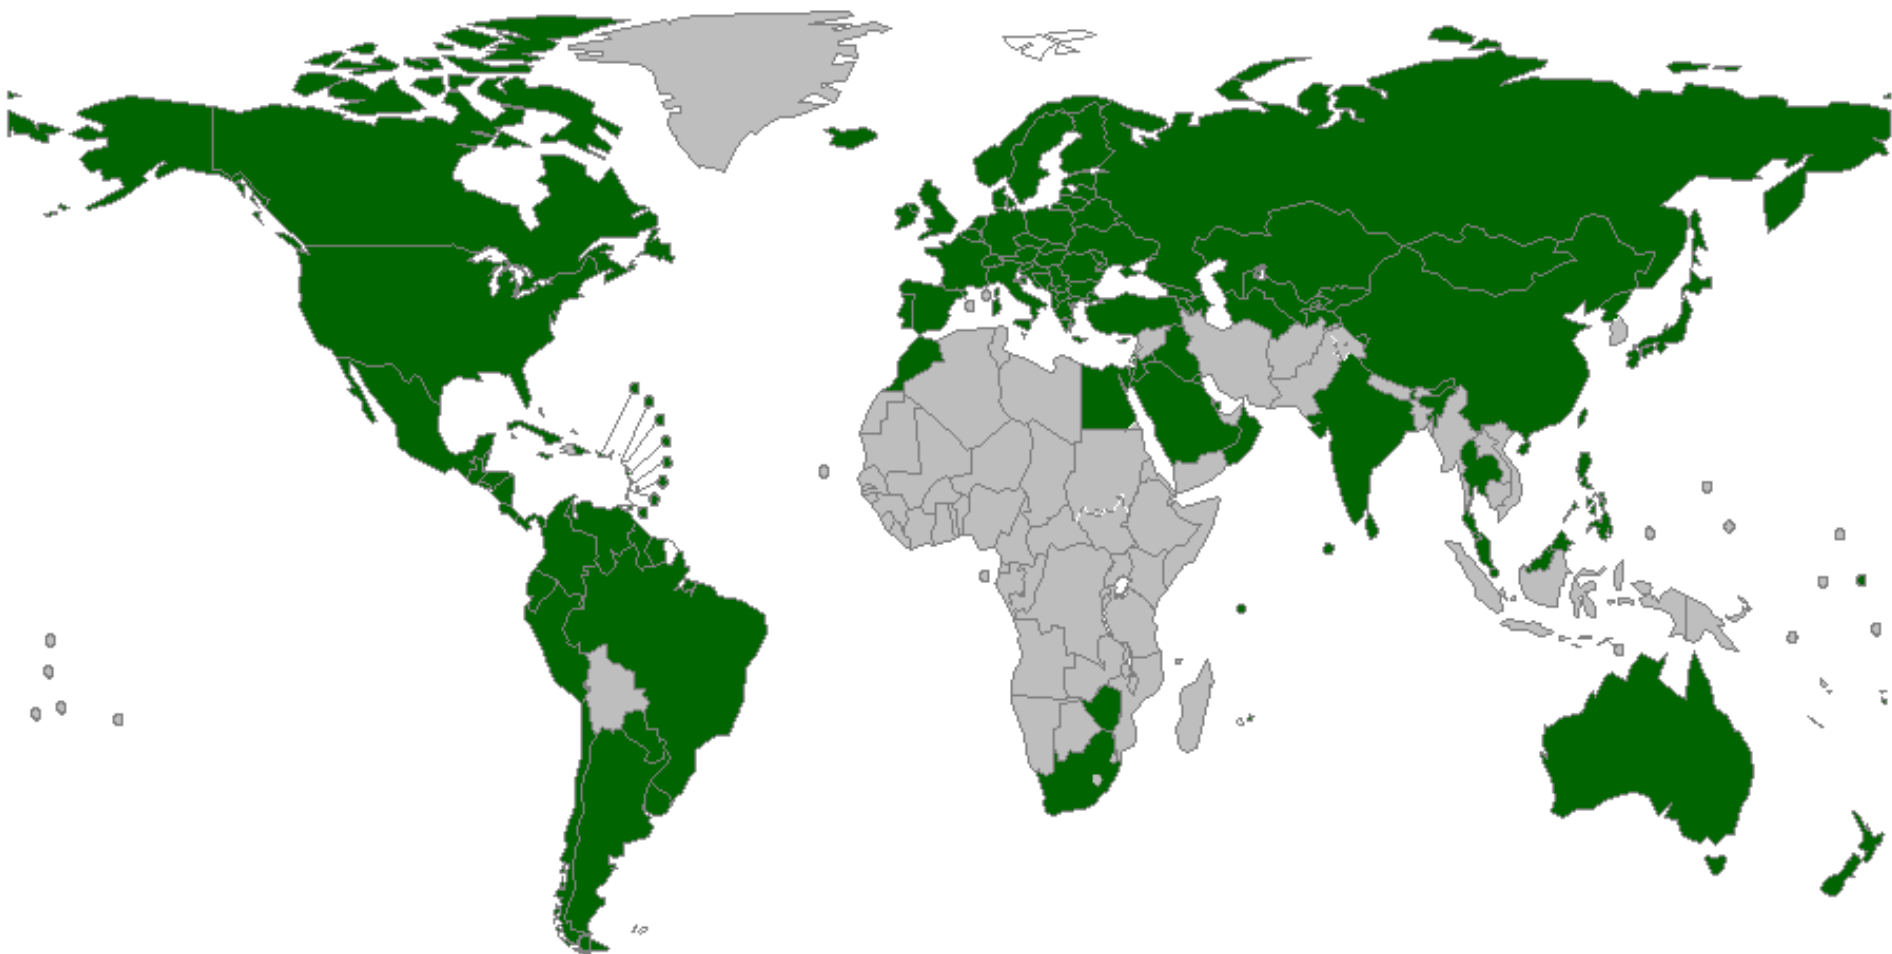

Incidence *not* directly measured in most HBCs

Prevalence surveys 1990 – 2015 (completed and planned)

Data on TB deaths (HIV-) from vital registration and surveys

Projections

*Once you know what it is you want to be true,
instinct is a very useful device
for enabling you to know that it is*

Douglas Adams

Global burden since 1990

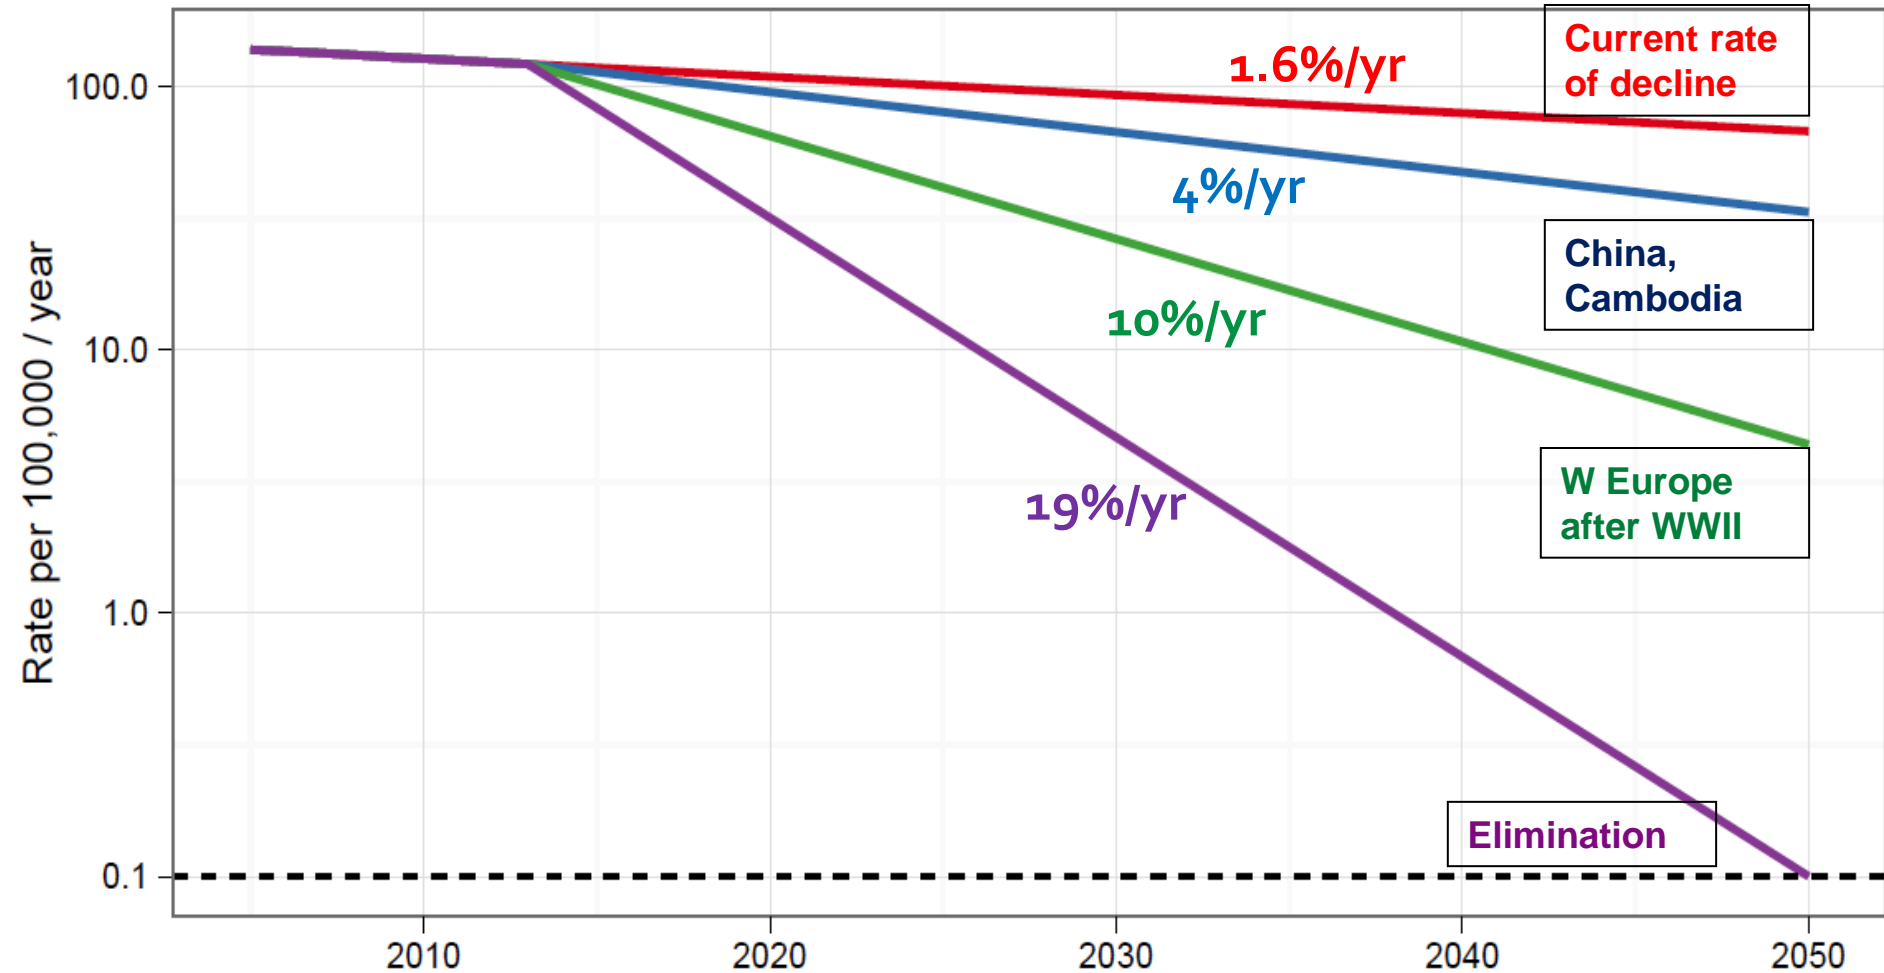

Number of new cases (million)

Number of TB deaths (million)

Can we reach TB elimination by 2050? (< 1 case / million)

Can we prevent TB?

World
7 billion

Infected
 ≈ 2.3 billion

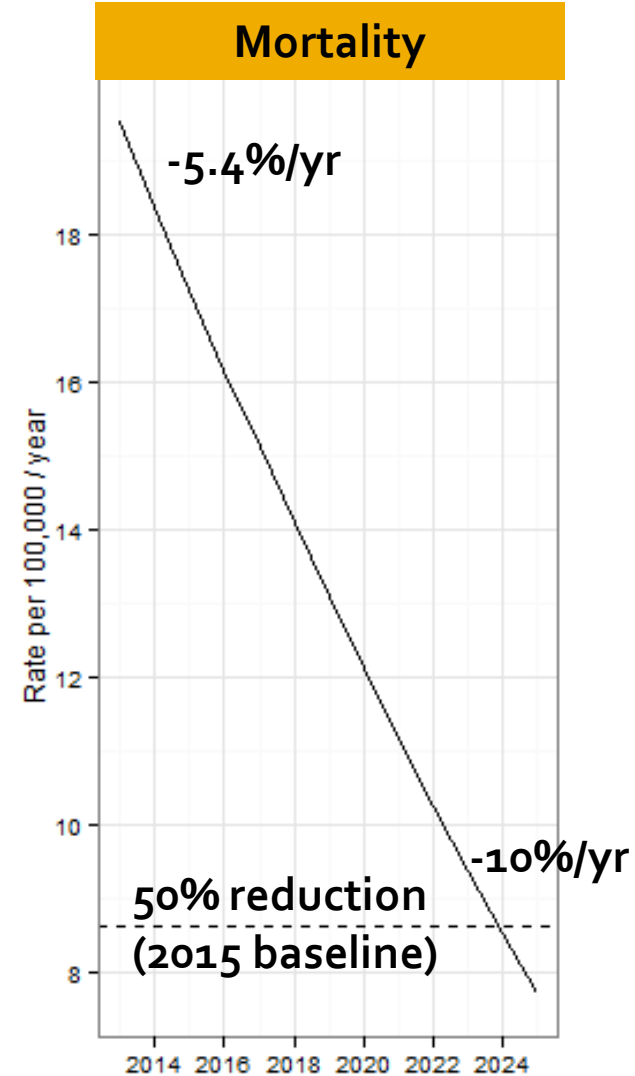

Disease
 ≈ 9 million/yr

Reducing case fatality

- 16% globally is a very high rate compared with 2.5% in New Zealand
- **To drive the CFR downwards**, we need to
 - Detect TB earlier
 - Ensure high cure rates in detected but currently not routinely reported cases
 - Improve treatment outcomes in HIV-associated TB and MDR-TB

50% reduction in mortality 2015–2025

Can we halve mortality in 10 years?

- HIV declining, ART coverage expanding, IPT
- New rapid diagnostics
- Health insurance
- PPM expansion
- New drugs in phase 3 will contribute to improving global MDR-TB outcomes
- *New vaccines advancing towards phase 3*

Proposed post-2015 TB targets

- 50% reduction in TB mortality (2015-2025)
- ***Overarching target on TB morbidity to be determined***
- ***TB elimination by 2050***
- *Targets specific to each strategy component, including treatment success rate, etc..., with country-level adaptation*

Country-level adaptation

Reality is frequently inaccurate

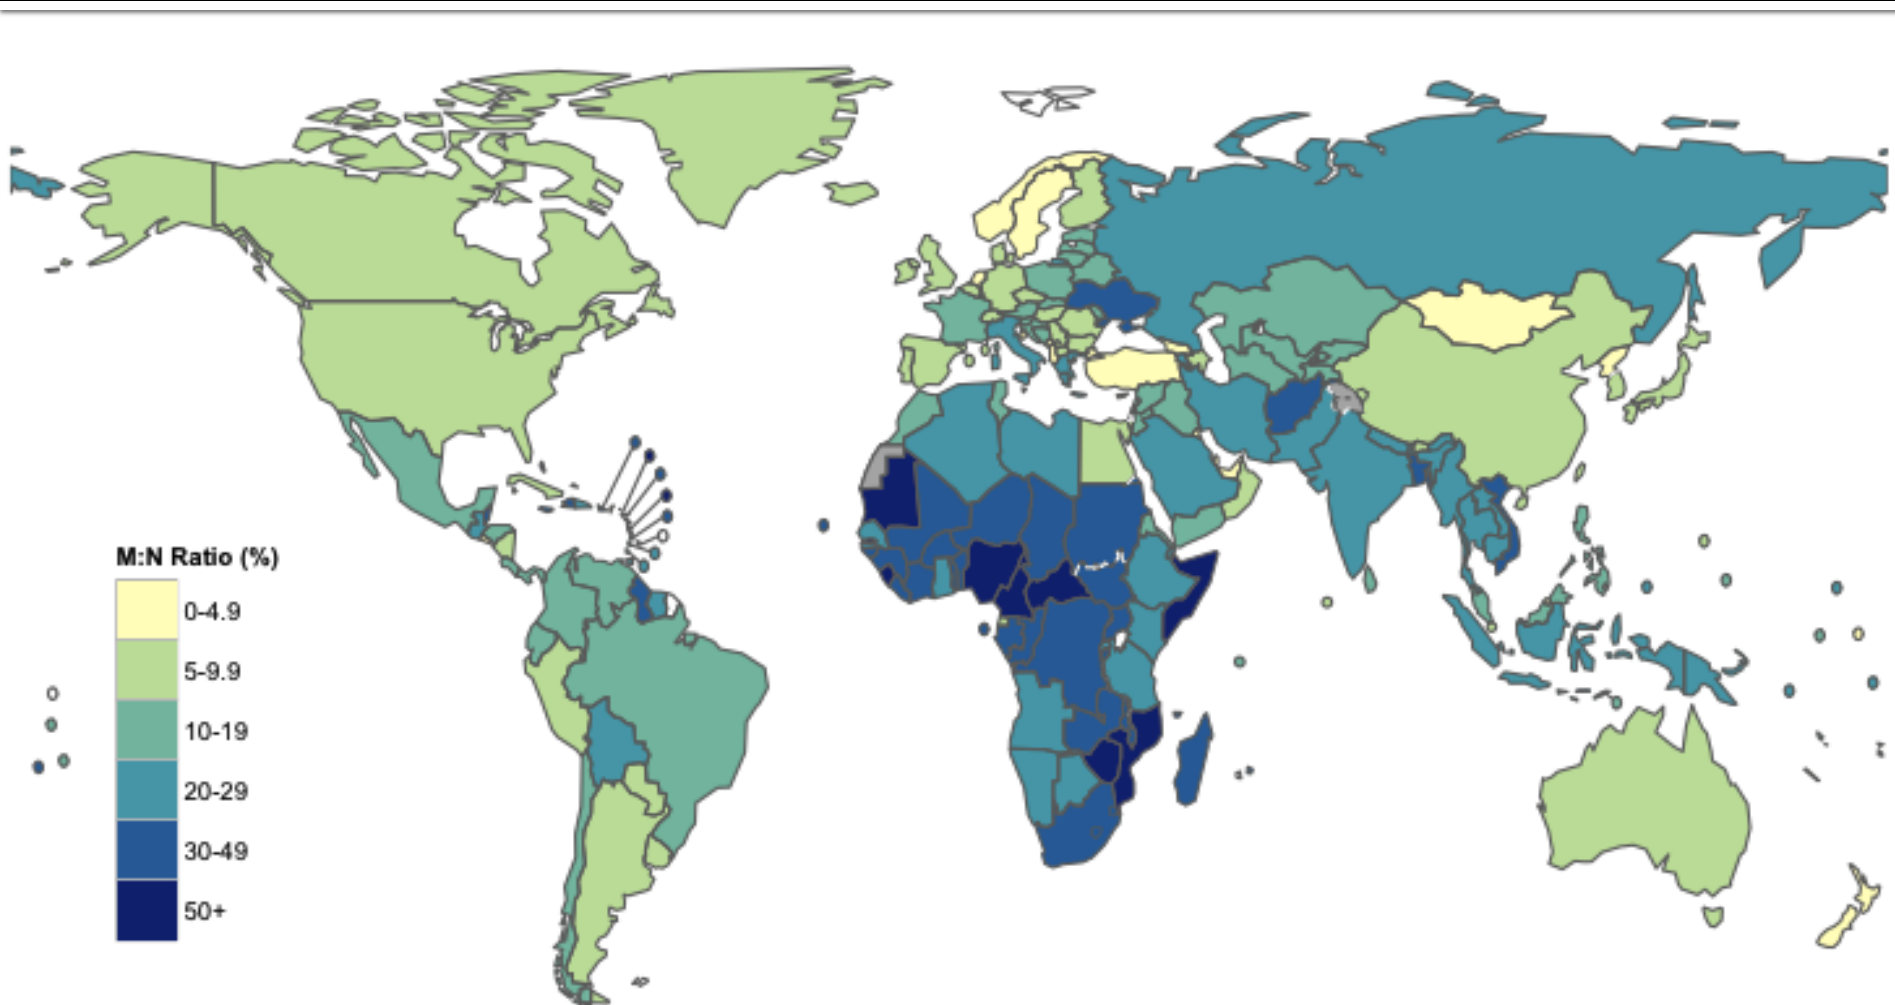

Douglas Adams

A new indicator, the MN ratio*

- **Driven downwards by:**
 - Early diagnosis
 - Reduced under-reporting
 - Better quality of care (including TBHIV and MDR)
- **Measureable at subpopulation level** (e.g. in children, in women)
- Not affected by uncertainty about incidence
- Can be used for **national target setting**

*MN = Mortality:Notification

Inequities in Mortality:Notifications

In summary,

- Proposed new targets
 - 50% reduction in mortality over 2015-2025
 - *Morbidity target*
- Very ambitious but feasible
- Adapt new strategy with country specific indicators (e.g. MN ratio) and component-specific targets, including success rate
- Dramatic changes needed to eliminate TB as soon as 2050 (e.g. post-exposure vaccination)
